EVENT REPORT

NOIS- Nitrous Oxide Inhalation Sedation in Paediatric dentistry

Nitrous oxide also known as laughing gas in combination with Oxygen is the most commonly used inhalational anaesthetic in dentistry. The main indication for NOIS is management of mild to moderate dental anxiety in children and adults as it is an effective analgesic, anxiolytic and anaesthetic agent. Nitrous oxide/ Oxygen combination has an excellent safety record. When administered by trained personnel on carefully selected patients with appropriate technique and equipment, it is a very effective agent for providing pharmacological guidance of behaviour in children and has been successfully used as an adjuvant to other Non pharmacological behaviour management techniques. The speaker gave an overview of NOIS in Pediatric dentistry and its clinical implications.

The lecture was followed by an interactive question and answer session through which the speaker shared his clinical experience and enlightened the participants.
