Write in detail about proximal stripping:-

Methods of Gaining space:-

- A) proximal stripping ✓
- B) Expansion ✓
- C) Extraction ✓
- D) Distalization ✓
- E) Uprighting of molars ✓
- F) Detoriation of posterior teeth ✓
- G) Proclination of anteriors. ✓

PROXIMAL STRIPPING:-

It is a method by which proximal surfaces of teeth are filed in order to reduce the mesio-distal width of teeth.

Synonyms :- Reproximation, slenderization, disting and proximal filing.

Routinely carried on lower anteriors it can also be done on upper anteriors & molar segments of both arch.

SECOND TERMINAL EXAM.

Name: Shreyas
Final year.

Enumerate Various Methods of gaining space in Orthodontics.

Write in detail about Proximal stripping.

Introduction:-

Correction of many malocclusion requires space in order to move teeth into more ideal locations.

space is required for correction of crowding, retraction of proclined teeth, levelling of steep curve of spee, deterioration of Anterior teeth and for correction of unstable molar relation.

Planning space is an important aspect of treatment planning:

- A) Proximal stripping
- B) Expansion.
- C) Extraction.
- D) Distalization.
- E) Uprighting of molar
- F) Deterioration of posterior teeth.
- G) Proclination of Anterior.

1) Define orthodontic tooth movement enumerate various theories of tooth movement. Explain pressure tension theory.

Theories of tooth movement

- Pressure tension theory by Schwarz
- Blood flow theory by Bien
- Bone bending theory (Plexodontia).

Pressure tension theory

- Oppenheim in 1911 was the first person to study the bionic changes in the bone incident to orthodontic tooth movement.
- Schwarz (1932) is said to be the author of this theory.
- According to Schwarz, whenever a tooth is subjected to an orthodontic force, it results in areas of pressure & tension.
- The area of the Periodontium in the direction of tooth movement is under pressure, while the area of periodontium opposite to tooth movement is under tension.
- According to Huiss - the areas of pressure show bone resorption while areas of tension shows bone deposition.

Theories of tooth movement

- Initial phase → very rapid movement over a short distance.
- Lag phase → little or no movement occurs.
- Post lag phase → tooth movement progresses rapidly as the resistance of bone is overcome.
